

## Responsible NLP Checklist

Paper title: *WikiSeeker: Rethinking the Role of Vision-Language Models in Knowledge-Based Visual Question Answering*

Authors: *Yingjian Zhu, Xinming Wang, Kun Ding, Ying Wang, Bin Fan, Shiming Xiang*

How to read the checklist symbols:

- the authors responded 'yes'
- the authors responded 'no'
- the authors indicated that the question does not apply to their work
- the authors did not respond to the checkbox question

For background on the checklist and guidance provided to the authors, see the [Responsible NLP Checklist](#) page at ACL Rolling Review.

---

### A. Questions mandatory for all submissions.

- A1. Did you describe the limitations of your work?

*This paper has a Limitations section.*

- A2. Did you discuss any potential risks of your work?

*The paper discusses potential risks in the "Ethical Statement" section.*

### B. Did you use or create scientific artifacts? (e.g. code, datasets, models)

- B4. Did you discuss the steps taken to check whether the data that was collected/used contains any information that names or uniquely identifies individual people or offensive content, and the steps taken to protect/anonymize it?

*The authors simply state in the "Ethical Statement" that the datasets used (EVQA, InfoSeek, and M2KR) are open-source and that their research in the KB-VQA domain does not entail risks pertaining to human ethics and values.*

- B6. Did you report relevant statistics like the number of examples, details of train/test/dev splits, etc. for the data that you used/created?

*4.2 Implementation Details, Appendix A Dataset Details, Appendix C.3 Training Dataset of Inspector*

### C. Did you run computational experiments?

- C2. Did you discuss the experimental setup, including hyperparameter search and best-found hyperparameter values?

*4.2 Implementation Details, Appendix B Parameter Searching*

- C3. Did you report descriptive statistics about your results (e.g., error bars around results, summary statistics from sets of experiments), and is it transparent whether you are reporting the max, mean, etc. or just a single run?

*Due to the significant computational resources and time required to fine-tune and evaluate large-scale language and vision-language models (e.g., Qwen2.5-7B, Qwen3-VL-8B) on massive datasets like EVQA and InfoSeek, performing multiple runs with different random seeds is prohibitively expensive. Therefore, the reported metrics are based on a single complete run. Additionally, we employ greedy decoding (temperature = 0) during the generation and inspection phases, which makes the inference process highly deterministic, thereby naturally minimizing the variance of the results across different evaluations.*

---

*The Responsible NLP Checklist used at ACL Rolling Review is adopted from NAACL 2022, with the addition of ACL 2023 question on AI writing assistance and further refinements based on ARR practice. ACL 2026 used a subset of ARR checklist form.*

**D. Did you use human annotators (e.g., crowdworkers) or research with human subjects?**

D1. Did you report the full text of instructions given to participants, including e.g., screenshots, disclaimers of any risks to participants or annotators, etc.?

*(left blank)*

D2. Did you report information about how you recruited (e.g., crowdsourcing platform, students) and paid participants, and discuss if such payment is adequate given the participants' demographic (e.g., country of residence)?

*(left blank)*

D3. Did you discuss whether and how consent was obtained from people whose data you're using/curating (e.g., did your instructions explain how the data would be used)?

*(left blank)*

D4. Was the data collection protocol approved (or determined exempt) by an ethics review board?

*(left blank)*

**E. Did you use AI assistants (e.g., ChatGPT, Copilot) in your research, coding, or writing?**

E1. If you used AI assistants, did you include information about their use?

*(left blank)*
