

On the Use of Speech Recognition in Computer Assisted Translation

L. Rodr guez, J. Civera, E. Vidal, Francisco Casacuberta, C. Mart nez

Universidad Polit cnica de Valencia, Spain

Computer-Assisted Translation systems can be used by human translators to increase their productivity. In these systems, the computer suggests portions of target sentence that can be accepted or amended by a human translator. In the present work we will introduce speech as a novel way to interact with these systems. The rationale behind this approach is to increase the throughput and ergonomics. Different scenarios for this kind of speech interactions will be discussed along with some preliminary results.
