● CHALLENGE 1: SYMBOLIC TRANSLATION

- In this area we want to discuss possible approaches for translating a spoken language sentence (in its written form) to a signed utterance representation, e.g. a sequence of glosses.
- How much linguistics and lexicography is required?
- How much world knowledge is required?
- Do you use a corpus to inform the process, and how does the corpus have to look like?
- What triggers the use of sign-specific means of expression, such as productive signs and classifier constructions, or constructed action?
- What are good evaluation measures?
- How much detail must the target signed utterance representation contain?

Corpus-based approach: statistical/example-based

Early work: phase 1 (2004/2005)

- English → Sign Language of the Netherlands (Nederlandse Gebarentaal – NGT)
- ECHO project data (561 sentences)
- Glossing
- Hand-crafted basic example-based machine translation (MT) system
- Basic manual evaluations of gloss output

Preliminary experiments

The hare takes off

(Gloss RH English) (p-) running hare :

(Mouth) closed-ao :

(Mouth SE) /AIRSTREAM/ :

(Cheeks) p :

(Gloss LH English) (p-) running hare :

(Gloss RH) (p-) rennen haas :

(Gloss LH) (p-) rennen haas

Early work: phase 2 (2006-2008)

- English, German, Irish Sign Language (SL), German SL (Deutsche Gebärdensprache - DGS),
- Air Traffic Information System corpus (595 sentences)
- Manually glossed using ELAN (lacked NMF detail)
- Bidirectional MT using MaTrEx
- Avatar database of pre-created videos using Poser software – also addressed lack of NMF detail in glosses
- Manual and automatic evaluations
- Automatic scores: broadly comparable with contemporaries: 35-50% correct
- Manual evaluations: generally well received, but subjective, only 4 people

Example

English input: I'd like a flight

ISL Gloss output: **LIKE** **FLIGHT**

Evaluation Webpage

Sign Language Translation

Sentence 4

Sentence 4: Initials: SM

Intelligibility: How would you rate this video sentence in terms of understandable and correct ISL?

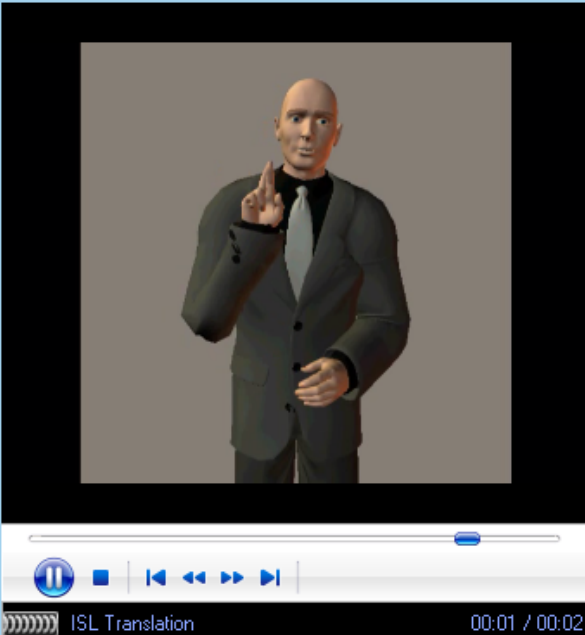

- Understood and correct
- Understood but somewhat incorrect
- Difficult to understand but I grasp the gist of it
- Incorrect or too confusing to grasp the meaning

Fidelity: How would you rate the video sentence as a translation of the English?

Please click on the box below to view the original English sentence. English sentence...

- Excellent translation, no errors
- Good translation, a few things incorrectly translated or missing
- Basic concepts are correct but mostly incorrect or information missing
- Completely incorrect translation

Submit

Early Attempts: what we learned

- Detailed, multi-level transcriptions
 - cause difficulty with alignments in training and for the evaluation process
 - Are labour intensive to create
 - Few standards, subjective
- Using glossing is ‘cheating’
 - Using one language to represent another is not adequate (Pizutto & Pietrandrea, 2001)
 - Pidgin form of spoken language
 - Becomes computer-assisted translation rather than MT (ambiguity resolved, lexical gaps filled subjectively...)
- Individual pre-made videos don’t make for natural sign transition
- EBMT showed no significant improvement

Current Work

- Patients with Limited English (2008 – present)
- English → Irish Sign Language
- Multimodal patient—medical-receptionist appointment booking corpus (396 sentences)
- Manual transcription using HamNoSys
- Animated avatar using software of University of East Anglia
- Corpus collection complete, exploratory MT beginning
- ~~The results are amazing! The problem is solved and we can all go home now!~~

Example

- Question: how do we maintain expressibility and content in the SL but keep text to minimum for MT?
- English: `hello, can i make an appointment.`
- ISL: `sid5 sid14 sid117 sid27 sid118 sid7`

Transcription of utterance in SiGML

<utterance spoken="1.26 Hello, can I make an appointment.">

<sign gloss="HELLO AS 2" signid="5"><mouth>hIUUUO</mouth><src editable="false"/><gol editable="false"/><loc editable="false"/><hand/><limbs/><facialexpression/>

<hamnosys>hamflathand,hamextfingerul,hampalmdr,hamforehead,hamlrbeside,hamseqbegin,hamtouch,hamindexfinger,hamseqend,hamreplace,hamfinger2345,hamfingerbendmod,hambetween,hamflathand,hamextfingerol,hambetween,hamextfingeru,hampalmi,hamshoulders,hambetween,hamshoulders,hamlrat,hamarmextended</hamnosys>

</sign>

<sign gloss="GST-GET_ATTENTION" signid="43"><mouth/><src editable="false"/><gol editable="false"/><loc editable="false"/><hand/><limbs/><facialexpression/>

<hamnosys>hamflathand,hamthumboutmod,hambetween,hamfinger2345,hamextfingeruo,hamextfingerol,hambetween,hamextfingero,hampalmd,hamshouldertop,hamarmextended,hamparbegin,hamnodding,hamfingerplay,hamparend,hamrepeatfromstart</hamnosys>

</sign>

<sign gloss="I VS 3" signid="117"><mouth>m</mouth><src editable="false"/><gol editable="false"/><loc editable="false"/><hand/><limbs/><facialexpression/>

<hamnosys>hamfinger2,hamthumbacrossmod,hambetween,hamfinger2,hamthumbacrossmod,hamfingerstraightmod,hamindexfinger,hamextfingeril,hampalmr,hamshoulders,hamclose,hammovei,hamsmallmod</hamnosys>

</sign>

<sign gloss="BOOK_appointment" signid="7"><mouth>@pOm@</mouth><src editable="false"/><gol editable="false"/><loc editable="false"/><hand/><limbs/><facialexpression> FU </facialexpression>

<hamnosys>hamsymmpar,hamflathand,hamparbegin,hamextfingeru,hamplus,hamextfingeror,hamparend,hampalmu,hamparbegin,hamlips,hamclose,hamplus,hamchest,hamparend,hamparbegin,hamseqbegin,hamreplace,hamextfingero,hampalmd,hamchest,hamseqend,hamplus,hamnomotion,hamparend</hamnosys>

</sign>

<sign gloss="CAN" signid="52"><mouth>k}n</mouth><src editable="false"/><gol editable="false"/><loc editable="false"/><hand/><limbs/><facialexpression> RB WB </facialexpression>

<hamnosys>hamfinger23,hamextfingeru,hampalmd,hamshoulders,hamclose,hamparbegin,hamreplace,hamextfingerdo,hamparend</hamnosys>

</sign>

Encapsulating data

```
<sign gloss="HELLO_AS_2" signid="5">
  <mouth>hIUUUO</mouth><src editable="false"/><gol
  editable="false"/><loc editable="false"/><hand/><limbs/
  ><facialexpression/>
```

```
<hamnosys>hamflathand,hamextfingerul,
ad,hamlrbeside,hamseqbegin,hamtouch,h
qend,hamreplace,hamfinger2345,hamfing
en,hamflathand,hamextfingerol,hambetwe
palml,hamshoulders,hambetween,hamsho
mextended</hamnosys>
```

```
</sign>
```

Current Work Considerations

- Do we maintain expressibility and content of the SL?
- Need to better investigate the MT process, the corpus and see how we can encode and transfer this information across
- Linguistic information will not come through via ID tags, may need to alter this to encode the information for EBMT
- HamNoSys offers a more comprehensive, faithful description of an SL than glossing
- Using the UEA avatar tool, MT can now be performed on-the-fly and without pre-loaded videos that can be unrealistic.
- Don't yet know what we're missing in terms of sign-specific linguistic information...let the fun begin!

Addressing the Challenges in the Context of Corpus-based Machine Translation

- The corpus, its form (notation) and what we can glean from it

- Output format and evaluation

The corpus, its form (notation) and how we can exploit it

- A corpus is a highly valuable linguistic resource
 - For linguistic analysis and collection, for seeding data-driven MT
 - But the problem is getting enough AND in the same format
 - It can take aaaaaaaaaaaages to create one
 - Solution: central repository and standards?
- Do we take advantage of glossing and how it makes MT easier?
- Or do we consider it potential misrepresentation and choose an alternative format?

Detail of Output Representation

- How much detail must the target signed utterance representation contain?
 - Consider representation as transcribed, text-based annotation:
 - Less detail = easier translation
 - More detail = better animation
 - Consider representation through an avatar.
 - animated representation should be fully articulate, human-like, competently use non-manual features and the signing space accurately.
 - realism of avatars in relation to the ‘uncanny valley’, how realistic can an avatar be before it gets disconcertingly real? Where is the line of acceptability?
- Is perfect output necessary?
 - Mainstream MT
 - Gisting
 - Not perfect, but maybe helpful
 - Not trying to replace interpreters, and it shouldn’t!

Evaluation

- What are good evaluation measures?
- Automatic evaluation
 - Not yet possible for avatars
 - BLEU and error rates used in mainstream spoken language MT can be adopted for transcription-based output
 - Internal progress of the MT can be compared
- Human evaluation
 - Artificial for transcriptions
 - imperative – evaluate actual signing
 - Evaluates system as a whole
 - Subjective evaluation

Conclusions

- We all need corpora – the more the better
 - Wouldn't a central repository be great?
- Transcription should faithfully represent the SL...but:
 - The simpler it is, the less faithful it is?
 - The more complex it is, the more difficult it is for MT?
- Evaluation is imperative
 - Automatic and manual
 - Whole pipeline or individual components
 - Guidelines/rules set out
- Lots done, more to do!

Thank you/ Go raibh maith agaibh
