History

- Phrase-based approach (early 2000)
 - state-of-the-art results for many MT tasks
- Bilingual *n*-gram approach (an alternative to PBMT)
 - Derives from the finite-state perspective introduced by (Casacuberta and Vidal, 2003)
 - First implementation dates back to 2004 (Ph.D. at UPC)
 - Extended for the last three years (Postdoc at Limsi-CNRS)

Bilingual <i>n</i> -gram approach to SMT	Decoding	The NCODE toolkit	Comparison:	NCODE vs. $% \left({{\left({{{\left({{{\left({{{\left({{{\left({{{}}}} \right)}} \right)_{i}}} \right)_{i}}} \right)}_{i}} \right)}} \right)$	Moses	Concluding remarks

000						

Standard SMT mainstream

- 1 take a set of parallel sentences (*bitext*)
 - align each pair (f, e), word for word
 - train translation model: the "phrase" table $\{(f, e)\}$
- 2 take a set of monolingual texts
 - train statistical target language model
- 3 make sure to tune your system
- 4 translate $\mathbf{f} = \underset{\mathbf{e} \in E}{\operatorname{argmax}} \{\sum_{k=1}^{K} \lambda_k F_k(\mathbf{e}, \mathbf{f})\}$
- 5 evaluate
- 6 not happy ? goto 1

000				

Underlying formal device: finite-state SMT

- phrase-table lookup [pt] is finite-state
- n-gram models [Im] can be implemented as weighted FSA
- monotonic decode of f:

 $\mathbf{e}^* = bestpath(\pi_2(\mathbf{f} \circ pt) \circ lm)$

Bilingual <i>n</i> -gram approach to SMT	Decoding	The NCODE toolkit	Comparison:	NCODE vs.	Moses	Concluding remarks
0	0	0				
0	0	0				
•	0	0				
000						

Underlying formal device: finite-state SMT

- phrase-table lookup [pt] is finite-state
- n-gram models [Im] can be implemented as weighted FSA
- monotonic decode of f:

 $\mathbf{e}^* = bestpath(\pi_2(\mathbf{f} \circ pt) \circ lm)$

• decode with reordering:

 $\mathbf{e}^* = bestpath(\pi_2(\mathbf{perm}(\mathbf{f}) \circ pt) \circ lm)$

perm(f) is a word lattice (FSA) containing reordering hypotheses

Bilingual *n*-grams

- a **bilingual** *n*-gram language model as main translation model
 - Sequence of tuples (training bitexts):

we	want	translations	perfect
nous	voulons	des traductions	parfaites

Bilingual *n*-grams

- a bilingual *n*-gram language model as main translation model
 - Sequence of tuples (training bitexts):

we	want	translations	perfect
nous	voulons	des traductions	parfaites

• smaller units are more reusable than longer ones (less sparse)

we want	translations	perfect	
nous voulons	des traductions	parfaites	

Bilingual *n*-grams

- a **bilingual** *n*-gram language model as main translation model
 - Sequence of tuples (training bitexts):

we	want	translations	perfect
nous	voulons	des traductions	parfaites

• smaller units are more reusable than longer ones (less sparse)

we want	translations	perfect
nous voulons	des traductions	parfaites

translation context introduced via tuple n-grams

 $p((s,t)_k|(s,t)_{k-1},(s,t)_{k-2})$

multiple back-off schemes, smoothing techniques, etc.

Search complexity and speed ups

• Complexity: upper bound of the number of hypotheses valued for an exhaustive search:

$$2^J \times (|V_u|^{n_1-1} \times |V_t|^{n_2-1})$$

- J is the length of the input sentence,
- $|V_u|$ is the size of the vocabulary of translation units,
- $|V_t|$ is the size of the target vocabulary.
- n_1/n_2 are the order of the bilingual/target *n*-gram LMs,

- J is the length of the input sentence,
- $|V_u|$ is the size of the vocabulary of translation units,
- $|V_t|$ is the size of the target vocabulary.
- n_1/n_2 are the order of the bilingual/target *n*-gram LMs,
- Speed ups:
 - Recombination: exact (unless N-best output required)
 - *i*-best hypotheses within a stack (beam pruning)
 - *i*-best translation choices (based on uncontextualized scores)
 - prune reordering rules (reduce the size of the input lattice)
 - use several threads (when possible)

0	0	0				
0	0	0				
000						

Model estimation

training.perl [--first-step --last-step --output-dir]

- NCODE systems are built from a training bitext (f,e) and the corresponding word alignment (A).
 Part-of-speeches (f.pos) are (typically) used to learn rewrite rules
- Target n-gram LMs are not estimated within training.perl
- Training is deployed over 8 steps

t Comparison: NCODE vs. MOSES Concluding r

Model estimation

Step 0: lexicon distribution

- Distributions computed based on counts using word alignments:

$$P_{lex}(e, f) = \frac{count(f, e)}{\sum_{f'} count(f', e)}$$
; $P_{lex}(f, e) = \frac{count(f, e)}{\sum_{e'} count(f, e')}$

- NULL tokens are considered (to allow tuples with NULL target side)

he NCODE toolkit

it Comparison: NCODE vs. MOSES Concluding remar

Model estimation

Step 3: tuple pruning & uncontextualized distributions [--max-tuple-length --max-tuple-fert --tuple-nbest]

- Tuples filtered following several constraints (length, fertility, n-best translation choices per source segment)
- Conditional probability (x2): $P_{rf}(e, f) = \frac{count(f, e)}{\sum_{f'} count(f', e)}$; $P_{rf}(f, e) = \frac{count(f, e)}{\sum_{e'} count(f, e')}$
- Lexicon weights (x2):

 $P_{lw}(e,f) = \frac{1}{(J+1)^l} \prod_{i=1}^l \sum_{j=0}^J P_{lex}(e,f) \quad ; \quad P_{lw}(f,e) = \frac{1}{(l+1)^J} \prod_{j=1}^J \sum_{i=0}^l P_{lex}(f,e)$

Bilingual	<i>n</i> -gram	approach	to	SMT	Decodir
0					0
0					0
0					0
000					

Model estimation

Step 4: bilingual n-gram Im [--train-src-bm --train-trg-bm --options-bm --name-src-bm --name-trg-bm]

- Standard n-gram LM (units built from words):

$$p(f_1^J, e_1^I) = \prod_{k=1}^K p((f, e)_k | (f, e)_{k-1}, \dots, (f, e)_{k-n+1})$$

Options passed to SRILM, Ex: -options-bm -order_3_-unk_-gt3min_1_-kndiscount_-interpolate

Bilingual	<i>n</i> -gram	approach	to	SMT	Decodir
0					0
0					0
0					0
000					

Model estimation

Step 4: bilingual n-gram lm [--train-src-bm --train-trg-bm --options-bm --name-src-bm --name-trg-bm]

- Bilingual units built from: POS-tags, lemmas, etc., or any src/trg combination. Ex:

(f, e)^{wrd} : 'translations|||traductions' (f, e)^{lem} : 'translation|||traduction' $(f, e)^{pos}$: 'NNS|||Noun' (f, e)^{lem:pos} : 'translation|||Noun'

- Each unit (--train-src --train-trg) is assign to one token (--train-src-bm --train-trg-bm)

Bilingual	<i>n</i> -gram	approach	to	SMT	Decod
0					
0					0
0					0
000					

The NCODE toolkit Comparison: NCODE vs. MOSES Concluding remarks

Model estimation

Step 5: rewrite rules (POS-based) [--max-rule-length --max-rule-cost]

- Rewrite rules are automatically learned from the bitext word alignments
- POS tags are used to gain generalization power
- Rules are filtered according to: $P(f \rightsquigarrow f^r) = \frac{count(f, f^r)}{\sum_{f' \in perm(f)} \frac{count(f, f^r)}{count(f, f^r)}}$

Bilingual	<i>n</i> -gram	approach	to	SMT	Decod
0					
0					0
0					0
000					

Decoding	Т
)	
)	C

Model estimation

Step 6: lexicalized reordering

- Four orientation types: (m)onotone order; (s)wap with previous tuple; (f)orward jump; (b)ackward jump.
 And two aggregated types: (d)iscontinuous: (b) and (f); and (c)ontinuous: (m) and (s)
- Smoothed maximum likelihood estimator, $\sigma = 1 / \sum_{o} count(o, f, e)$:

$$P(\textit{orientation}|f, e) = \frac{(\sigma/4) + \textit{count}(\textit{orientation}, f, e)}{\sigma + \sum_{o} \textit{count}(o, f, e)}$$

Bilingual	<i>n</i> -gram	approach	to	SMT	[Decod
0					(С
0					(C
0					(C
000						

Model estimation

Step 7: source (unfolded) n-gram Im [--train-src-unf --options-sm --name-src-unf]

- n-gram LM estimated over reordered training source words (lemmas, POS, etc.)
- Reordering introduced in the tuple extraction process. Ex: 'we want translations perfect'
- Options passed to SRILM, Ex: -options-sm -order_5_-unk_-kndiscount_-interpolate

Bilingual	<i>n</i> -gram	approach	to	SMT	Decoding
0					0
0					0
0					0
000					

Inference

.

binrules [-wrd s -tag s -rrules s -maxr i -maxc f]

- Rules extracted from reorderings introduced in the tuple extraction

translations perfect vanslations

- Referred to source-side tokens (words, POS, etc.): NNS JJ --- JJ NNS
- Filter rules (discard noisy alignments) maxr=10 (size) maxc=4 (cost, -logP)

- BLEU : Translation accuracy
- #units : Number of phrases/tuples (millions) after training (limited to 6 tokens)
- Memory : Memory (Mb) used by each decoder
 - Speed : Decoding speed (Words/second) (single-threaded translations)

- Slightly higher accuracy results for NCODE (within the confidence margin)
- NCODE outperforms MOSES in data efficiency:
 - smaller set of tuples than phrases (full: 20 times smaller)
 - lower memory needs for $\rm NCODE$ (full: \sim half than $\rm MOSES)$

- Developed to run on $\ensuremath{\mathrm{Linux}}$ systems
- Written in Perl and $\operatorname{C++}$
- Prerequisites
 - to compile: $\ensuremath{\operatorname{KENLM}}$ and $\ensuremath{\operatorname{OPEnFst}}$ libraries
 - to run: ${\rm SriLM}$ and the MERT implementation in ${\rm MOSES}$
